

Every response from a real, unique human

Bots and repeat takers poison paid studies. HumanCheck locks them out before they ever reach yours: a five-second face check, about two cents a verification, no code.

Each verified human gets one passcode. Alchemer's own login gate rejects reuse, so one person cannot return as five.

The passcode fills itself in at your study's gate, and with auto-submit on the respondent never even sees a login page. Blocked traffic never enters your data and never gets paid: you pay only for real, first-time respondents.

Set it up in Alchemer

Five steps · once per study · no code

1

Create your study

Build as usual; leave page 1 empty. That is where the gate goes.

2

Create a verification

In the VerifyYou dashboard, pick Alchemer and paste your Alchemer link.

3

Add your passwords

Login/Password action on page 1, one-time passwords, one per line.

4

Set it to fill itself in

Pre-populate with the merge code; auto-submit makes the gate invisible.

5

Share your study link

Everyone who reaches your study came through the check.

No photo is ever shared with you or with Alchemer, only a yes or no. Your study receives a verdict and a passcode, never a face, a name, or contact details. Alchemer today; the same mechanism fits any platform.
