

# Verify every response is from a unique human

HumanCheck locks bots and repeat humans out before they ever reach your study. About five seconds per respondent, no code.

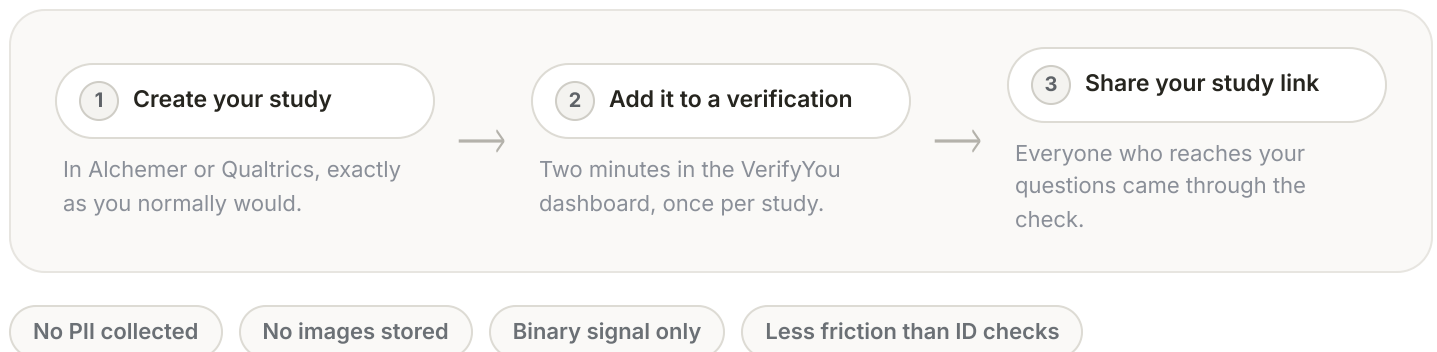

## THEIR FIVE SECONDS

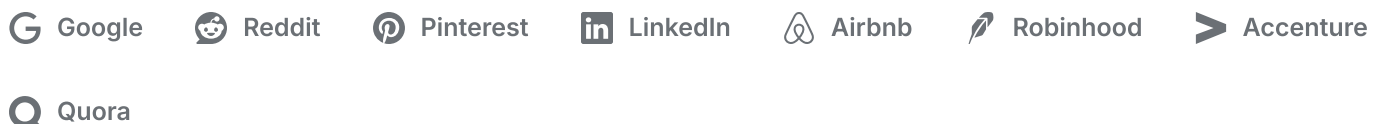

**Each verified human gets one passcode, and your platform's own gate rejects reuse, so one person cannot return as five.**

A duplicate face never earns a second pass, a spent pass is dead forever, and blocked traffic never enters your data or your incentive spend. The check proves who they are, not how carefully they answer: keep your attention checks, and let the gate close the door they cannot.

## YOUR SETUP

## BUILT BY HUMANS FROM

**No photo is ever shared** with you or your survey platform, only a yes or no. Your study receives a verdict and a passcode, never a face, a name, or contact details. Alchemer and Qualtrics today; the same mechanism fits any platform.
