

● HUMANCHECK · VERIFIED HUMANS

The respondents behind your data are *supposed to be real people*

A roughly five-second active selfie check confirms a real, live, unique human behind every response, so the data your study runs on actually is.

BUILT BY HUMANS FROM

 Google  Reddit  Pinterest  LinkedIn  Airbnb  Robinhood  Accenture  Quora

**Blocks bots and LLM-contaminated responses**

A live selfie check is hard to fake: a script, a replay, or a respondent pasting from an LLM still has to present a real human to the camera.

**One person cannot become ten respondents**

Each verified human earns one one-time pass per study, so the same person cannot fan out across accounts to fake a diverse sample.

**Works inside your survey platform**

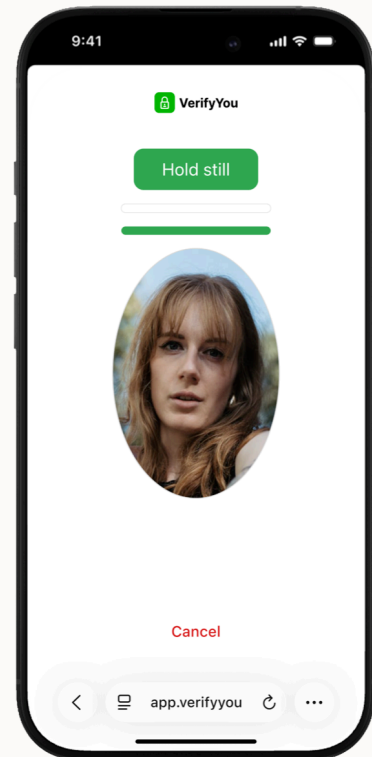

The pass fills itself in at your study's own gate on Alchemer or Qualtrics. No integration, no platform permission, no code.

**The same person returns across waves**

Re-verification recognizes a returning respondent with less friction, so wave two is answered by the same human as wave one.

**No PII, lighter than ID-based checks**

No PII is collected and images are never stored: an irreversible code, and your study sees only verified or not verified.

Set up once per study, in minutes: ① Create your study ② Add it to a verification ③ Share your study link.
The check handles the rest.
